HERE'S HOW YOUR PRESS WORKS

of printing. The Guide is written so is no mysterious business. that if you follow it, bein step at a

(Printers hold type as shown on page 6, but the first time hold it this way, if you like.)

time, you can do good printing. How-ever, if you just can't wait, you can

open a package of type (see page 4), put it in a case, and set up your name shown here). Place it in the chase (frame), also as per picture, put a dab of ink (no bigger than a good sized match head) on the ink table, smooth it out with one of the press rollers, and then take an impression on a piece of paper, turning up the screws on the back of the platen (see page 12) if necessary to make the printing show. The results this way very carefully. What you find there

These pictures show the main points but they will show you that printing

You can then go back to the begin-ning of this Guide, do your next job

more slowly, and get first-class, pro-fessional results. Read pages 1 to 11

see directions in this book.

may need considerable improvement, are the essentials. Beyond page ten

you will find helpful hints, and answers to any problems that may come up, but you do not need to read them

until vou feel like it.

Printing isn't difficult. During the five hundred years since its invention it has gathered up its own words for certain tools and parts of the press, with which you will soon be familiar and use just as you do baseball terms if you are a baseball fan, ur photographic terms if you are interested in photography. You can print without "speaking the lan-guage" but you'll find it helpful and fascinating to pick up the terms.

Here are some of them:

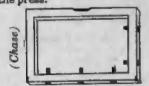

Bodkin-Small pointed instrument. handy around type (like an awl).

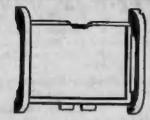

Brayer-Roller with a handle on it. to spread ink on ink table, or make printed proofs.

Case-The type case is a box or drawer with small compartments. one for each of the letters and characters in a font (assortment) of type. Chase-Frame which holds type, etc. in the press.

That Bed - Sometimes called chase back or backplate. Part of press into which chase (frame) fits, and which is removable on the Excelsior so that you Grippers - The long metal fingers

can use it for a smooth working sur-

Chane froms - Two flat steel bars that are placed inside the chase and used to prevent chase screws from damaging furniture (wood blocking). They are not used with quoins.

Composing Stick-Handpiece to nut type (letters) in when taking them from type case. If you do not have one. you can set your type directly in the chase (frame) which on the Excelsion

Press is removable and may be laid on a table, bench or box.

Font-Just another word for a packmun or assortment of type or letters in min size and style. See first page of type in catalog for details.

Furniture-Blocking to hold type (letters) in place.

Galley-Tray for holding type, etc., when not in press.

Gage Pins-Small pins which are used on press to hold paper or card in the right place for printing.

between the type and the platen which keep the paper in place when printing, and prevent its sticking after the sheet has been printed. Used on all except junior models.

Imposing Surface-Smooth, level surface (Excelsior Press chase beds are removable and make a good imposing surface).

Impression Screws-Screws thru the back of the platen, which are used to get more or less force or squeeze in printing. The Guide tells how to use them. These have lock nuts on them, which can be used to hold them at just the right pressure. Leads-Narrow metal strips used to make space between lines-like this page.

Line Gage-Printer's ruler.

Matal Quotations-Metal blocks used for spacing around work.

PI-Jumble or mix-up of type.

Pica-A way of measuring, I picas make an inch.

Planer-Block of wood used with Tympan-The paper or cardboard mallet to smooth down everything padding on the platen.

that is in the printing frame (chase).

Platen-That part of the press on which you put your card or paper to be printed.

Point-A way of measuring, 72 points make an inch.

Quad Rule-Used for same purpose as brass or metal rule, but made in blocks like type.

Quads-Same as spaces but larger. (Used between sentences, etc.)

Quoins and Key-Wedges used to hold type, etc., in chase (printing frame). Not necessary on Excelsion Presses because material is held in place by screws in frame (chase).

Regiet-Narrow wood strips used to make more space between lines of

Rule-Brass or other metal strips to make ruled lines in printing.

Slugs - Same as leads but three times un thick.

Spaces -- Blank pieces of metal used between words

Here Are Answers to Some Common Questions

press? Little metal pieces called the use of the brass or metal rule gages or gage pins and metal fin- listed in the catalog. It comes in twogers called grippers. If you do not foot strips which may be easily cut have any gage pins (or gages), you to any lengths you want, or can be L-shapes about %s-inch from their heads, and push the long pointed ends into the paper pad (tympan) up to the angle of the pin-two at the botto hold the work up, me at the side for correct margin, or, you can paste or glue quads (the large blank metal pieces) on the padding.

What holds the paper in the How can I make ruled lines? By

furnished already cut to your order. Quad rule can also be used for the same purpose.

Can I print more than one color

without any extra equipment? Yes, all you need is the colored ink, which you will find listed in the catalog.

Does the price of type include that of both capital and small letters? If they are both shown in the specimen line in the catalog, the price includes both caps and small How many are there of each letletters; if the small letters are not ter in a font of monograms? shown, they are not made, for instance, 6A 12a means there are both make up any monogram combination. capitals and small letters in a font, 6A that it consists of caps only.

Does "12A" uver the fonts mean that the font consists of 12A. 12B, 12C, 12D, 12E? No. because you would run out of some letters before others if you had the same number of each. It means that, I vou count the number of A's in anything you want to print, you can get a general idea of how much type you need. In a type font or assortment there are more E's than A's, fewer B's, etc. See the specimen font and the information at the top of the first page of type for more complete de-

What is the difference between a regular font of type, SA, and a large font, 16A, for Instance? The large font is twice us big as the regular font. The larger the font, the cheaper it is to assemble it, hence we are able to give you bigger value for your money in them. See further on first page of type in the catalog. What do you meen by a 60-inch steel perforating rule listed in the cattent of border? There would be enough border in such a font to set approximately 60 inches in a straight side, or any variation of lt.

like type letters, so that you can weight.

make it up in any length or shape you want; and use it in as many jobs, one

after the other, as you please, just like type letters.

There are three of each so that you can

In the Riverside monograms there are not only three of each, but three of each size, so that you can make up either large or small monograms, or combinations of the two.

How can I make raised printing that looks like engraving or umbossing? You can do it with any press and the raised printing outfit listed in the catalog.

How long does it take to do raised printing? Just about as long as it takes to do the actual printing. The price you can get for it, however, is so much more that your profit makes the time well spent.

How can I make perforated lines for tearing tickets, coupons, etc. from stubs? This is done with the alog, which is put in the press just like the type, and the pressure of which makes the perforations.

line, or a square 15 inches on each How many leads are there in a nound? About ten feet.

is the border made all in one Huw many slugs? Slugs are three piece so that I would have to times as thick so there are just 1/4 as cut it? No, it is cast in small pieces many an there are leads in the same

Press parts and their names

Illustrating the layout of the California Type Case

so you can remove both chase and chase bed from the press, and set up your form (of type, etc.) directly on the chase bed, in the chase.

This prevents Pi, or mixing the form of type, if by any chance it is not well locked or tightened up in the chase. The sheet to be printed is placed un the platen, D, which, upon a downward pressure of the handle, or lever, E, gives the printed impression. The leverage in double, having two connections with the platen, which gives great power and prevents all twist and spring. The Excelsior front lever principle allows a sheet of any size to be printed, as the paper may project out on the sides. Chase irons (flat steel bars) are placed inside the chase, and are used to prevent the chase screws from damaging the furniture (wood blocking).

Ink is spread on ink table, C, which is removable for cleaning. The roller carriage is connected with the platen, and the rollers pass over the type twice before each impression. The ink table revolves, giving perfect distribu-tion of ink. Gripper fingers, F, work automatically with the swing-ing platen, and hold the paper for the impression, releasing it for removal of printed sheet. The impression or pressure is regulated by impression screws, which may be adjusted so as to bring the right pressure on all parts. The chase or chase bed, or both may be instantly removed from the press, or replaced by a pressure on the latch which holds them. The Junior press has a combined chase and chase-bed which is held in place by a screw.

The rotary jobbers act on exactly the same principle as the hand presses, and good results can easi-

TAKING A PROOF

ly be obtained by following these directions. If you have any difficulty, write to us explaining the trouble fully and clearly.

To Unpack the Type

Having one of your type cases at your right hand, open one of the packages or "fonts" of type. If your type is wrapped in a cardboard container lay it on a table or bench label down, tear off the sealing tape. and unhook the two cardboard ends. leave the package in the same posi-tion, unfold cardboard and the type will be face up. If your type is wrapped in paper lay the package on a table or bench so that it will unroll toward you, straighten out the ends of the

wrapper and unroll carefully until type is uncovered, standing face up on the wrapper. Do not try to remove it from the paper, but place small block of wood or something similar on each side, to prevent it falling over. Note the slip in each font regarding a proof. Directions for taking a proof are shown on page 5. Let that be the first thing you do. It will safeguard you against a shortage or putting the wrong letters in the wrong compartment.

After taking the proof, wipe off the face of the type with a little

This is the card we doscribe-WILLIAM J. HARRISON see page 10 INGURANCE for the way It will look in the chase. 61 WORTH STREET

gasoline, benzine, kerosene, Printoclene, or any similar cleaning liquid illustration shown elsewhere.) Your and, after placing strips of wood on meh side of the font to keep it upright, carefully remove the string. The letters will usually be found in regular, alphabetical order, but sometimes in ly distinguished. making up a font it is necessary to change the order somewhat, so notice each letter carefully before placing it in the case, according to the diagram. Beginners sometimes have difficulty to distinguish b, d. p. and g: n and u: , (comma) and (apostrophe). (See illustration on back of cover.) You will have no trouble with these if you remember fifth the thickness of the em. (See diathat the nick of the body of the type is gram).

smooth surface.

always at the bottom of the letter (see proof of the type will also help you to identify the letters.

Two or more fonts may be put in unu case if different in size so as to be readi-

The spaces and quads are put in a separate font, and are opened and laid in the case in the same manner. The em quad is the square one, the en quad or space is the one that is just half the thickness of the em quad, the 3- 4- and 5- em spaces are those that are respectively one-third, one-fourth or one

m use a smooth block of wood

press if you wish.

HOW TO SET TYPE

To Set Type

with something small and simple, such as a card, or one or two short lines of type. Shown here is a sample of a business card. Let's begin by setting this card, but use your name, address, etc., with any other alterations you may wish to make without getting it too complicated.

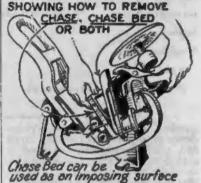

In typewriting, you adjust your margin stops to the longest line you are going to write, and in printing you start with spacing-out material un long as the longest stretch on the card, which in this case is from 6 of fil Worth Street to the 0 of 3810, and you will find this measures three inches. Printers call three inches 1E picas, their measurements making Il picas to the inch. If you have one of the standard assortments of furniture (wood blocking) you will find myeral pieces in it three inches (18 picas) long, which you can use in ture

Using Composing Stick

this set-up. If you received a composing stick with your outfit, set the movable part (called the three-inch furniture in the comfurniture that length to get the you are following the sample card.

right measurement, but allowing just a trifle more - the thickness You will find it best to start of a heavy cardboard, or about a 72nd of an inch (one point, printers call it). This is done so that when you tighten up your fin-

ished form the squeeze will come on the type and not on the furni-

To set up this job you may want something thinner than the wood to put between the lines, and if you do, the metal leads (line spacers) are made for that. If your leads are all longer than three inches, you can use a lead cutter, cut them with shears, or file a deep notch in them so that they will break in two. Be careful, though, that the finished length is the same as the furniture.

Hold the composing stick as the picture shows, in the luft hand. with the open side away from you. Put a piece of three-inch lead or inch line, using a piece of wood hand, pick up the first letter (if it will be a W. or whatever first on each side of the type, to have name you are setting up). Place the name properly centered. You it face up and with the nick can get this exactly in the middle AWAY from you, in the lower left hand corner of the stick. holding it in position with your thumb. Then pick up the next letter, put it in the stick next to the first and so on.

If you have no composing stick, take the chase unil chase bed from the press as shown in the picture. and lay them with one edge on a block, book or magazing about an inch high, an that the tilt will keep the type in place until you are ready to lock (tighten) the form. Arrange wome furniture (wood

Properly spaced line will lift without falling

blocking) in the chase so as to leave just the space in the center. needed for the form, then start putting in the three-inch spacing material and the type, just as described above for the composing stick.

Having set "William" (or your own first name), put a three or a four em space after the last letter. As you will see from the illustration, the difference between three or four um spaces is a matter of thickness, and you can take your choice. Set the initial and period, put in another space, then set the aut name.

What you have set will by no means fill out the three-inch space. so fill in on each end with the quads (thick spaces. - picture).

by the use of the spaces. The line should be just tight enough (if you are using a composing stick) so that if it is lifted up it will stay where put without falling down. but not so tight that it is hard to shove spaces in.

You now have your first line ast up, and can put some spacing muterial between II and the next one. If another line is to be close, like the word "Insurance" in the sample, you may want to use a lead (already mentioned-line spacer) which should be cut or filed to the right length. If you want more space, or are going to leave out that line and get down to the address, you can use the wood furniture - enough of it to space the first line far enough away from the bottom one.

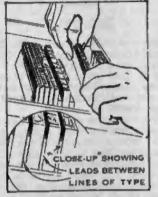

The street address and the telephone number (or perhaps you prefer the city and state) can be spaced out so that one is at unu end of the line and the other at the other, as shown.

If you have been using your chase, the type form is now ready to lock or tighten. If you have been setting in a composing stick this is the way to pick up your

Put another three-inch piece of wood furniture or lead at the bottom-perhaps several w you have being sure to use the same amount the room, so as to give you some-

PUTTING THE TYPE INTO THE CHASE

thing to hold onto. Now, do as the picture shows—grasp the type form (still with the bottom line away from you, as you see) with your inside fingers pressing a-

gainst the edges, squeezing tightly on ALL sides, lift carefully from the stick and place in the chase, which you have previously taken out of the press and laid on a flat surface. (Better use the chase bed for the surface unless you have something else you know is perfectly true and smooth).

All this may sound as if using a composing stick were more difficult than setting type in the chase in the first place, but there are numerous advantages, particularly on work with more lines. It is easier and quicker to set up type in the stick, and you man be entirely sure of getting all the lines "justified"that is, spaced with an equal degree of tightness, which helps to keep everything where it belongs, with no drop-outs when you have edge of the chase.

If you have been setting up the sample card, and are in a hurry to proceed, you can now skip as far as "Locking Up Form". However, if you are setting up something in column formation, like the lines of this guide, or any work a little more complicated than the

Substituting and space for another size

card, you will want to know a little more about spacing out your work. Suppose you are setting a line like this. Set up your line until it almost comes to the end. using three- or four-em spaces between the words. If there is not room to get in another word or syllable, increase the space between the words either by adding thin spaces until the line is filled out-(neither too loose nor too tight as already described) -or pull out one or num of the smaller spaces. and replace them with the next size larger. Similarly, if all but one or two letters of word will fit in the line, you can reduce the space between the words by substituting smaller spaces as far an necessary to get in your letters.

If you are setting big type you may find it necessary to cut spaces from paper or cardboard to propturned up the screws along the erly space out the line, or use thin brass or copper spaces (you will find these listed in the catalog).

Between the line you have just finished and the next one you can place n two point lead, cut to the right length. Lines can be set without any space between them if you wish, but you will find it best to put a piece of lead or brass rule as a divider between the two lines

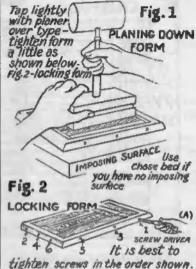

How to arrange a page with lines of unequal lengths

Example -set 'A' (top and bottom) one length, set'B' short length (slightly less than % of 'A') set 'C' separately. and fill in on each side to make exactly

when you are setting them, so that the individual letters of one do not bind on the other, moving the divider forward after each line is properly spaced.

represent lines of type.)

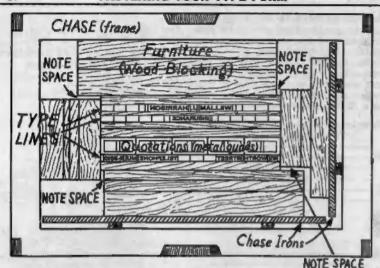

As in the case of the card on which we started, mura man can be put between the lines by using more two point leads, or six point slugs (printer's term for six point leads) wood blocking (reglet or furniture). When you have many lines set up ms you feel you can move from the composing stick to the chase safely for the first time, do the same as described with the card. Better take only three entire form.

Plane down form, tightening the same length as 'A'. (All lines (locking) as shown at (A)

or four lines at first, until you get familiar with it.

In the beginning we spoke of making the lines as long un the longest you expect to set. If some of them are so long that to do so would not be practical, you can break the short ones down into groups, just us the tabulating key does on a typewriter, and set these groups into your completed job just as you would individual forms. being very sure to make the spacing everywhere equal, so that turning up the chase screws will give a purchase on all parts of the

This is the way your card job will look when tightened up (locked) in a chase. Note open spaces to prevent tightening of one side from interfering with tightening of other side.

Locking Up the Form

the body of type and other matter for the screws to bear on. you have set up. "Locking a form" means tightening it so that when it is lifted it will hold together-in other words making it ready for the press.

Remove the chase bed and chase from the press and lay them together on a bench or table. Place lay a smooth surfaced block (planthe completed form us near the er) upon the form and strike lightcenter of the chase as possible, ly with mallet to push down any with the first line opposite the letters that may stick up above the screws, if lines run lengthwise of others. Now lock up firmly by the the chase, or toward the solid end screws, holding the fingers of one of the chase, if lines run crosswise. hand firmly on the furniture near Around the form, put furniture the screws to prevent it from (wood blocking), long pieces the springing up. Do not tighten the

long way, and short pieces un the short side. The iron strips furnished "Form" is the printer's term for should be placed next to the chase

Make sure that the type all stands squarely on its feet, that all the lines are of the same length and that everything is true and square. so that pressure will hold all evenly. Now turn screws just enough to press form together lightly, then

serews all on one side, nor any one never as far as it will go. at first. To do so may break your chase. Tighten each screw a little at a time, first on one side, then on the other, and so on until all are tight. Different presses have different arrangements of chase screws; some have more, some less.

On some presses (not the Excelsior) quoins (wedges) are used to lock the furm instead of screws. Proceed as

outlined, but put quoins in the chase, with furniture on both sides of them. Tighten each quoin | little at a time.

When locking any form, whether with more or quoins, do not lock any tighter than necessary to hold everything firm. Both screws and quoins exert an enormous pressure and, if too tightly locked, will spring the form or break the chase screw, or even the chase itself.

Never allow type or furniture to project below the bottom of the chase us it will prevent the chase from resting squarely against the bed, and you may not be able to get them together so that the chase latch on the press will fit over them and hold them securely in place. The bottom of chase, chase bed and, in fact, all parts of the press, must be kept cleaned of dirt, rust, dried ink, etc., for the best work.

Presswork

For small forms, cards, etc., the tympan and packing should be thin and hard, two or three sheets of thin, hard, smooth paper over a thin card-

roller (brayer) use one press roller

Smoothing out ink

Caution-Use no more ink than the size of a pea to start with.

IMPORTANT-See that Gripper Fingers are set will of the way of the type. so that it will not be smashed, yet in position to huld the paper or card being printed. Be sure to aut them an equal distance from chase and platen.

board. For larger forms a few sheets may be added. For solid forms of small type a somewhat softer tympan, such as four or five sheets of soft, news white paper, may give the best results.

Do not use too much packing of paper and cardboard under the tympan. Be sure to remove all previous makeready and packing before making a first impression on a new job. Remember that the harder the tympan and the lighter the impression, the sharper and clearer the printing, and the less the wear on the type. After a little experience you will be able to quickly choose the right tympan for any job. Platen or tympan assortments of special oiled paper and what is called pressboard are available, and listed in the paper section of the supply book.

Important-Before taking first impression, set the grippers about half way between the form and the platen, and make sure they will not touch any part of the form but will grip the paper or card being printed

GETTING THE PRESS'READY

while the impression is made. If the an undue strain will be placed on the break it.

INKING

Place a small portion of ink (about the size of m pea to begin with) on the ink table and spread it out with m hand roller, or if you do not have one, you can use one of the press rollers. It's possible to spread the ink by pushing the handle of the press up and down so the rollers will pass back and forth over the table, but if you do this, be sure the chase with its type is not in the press, because the type will become gummed up and require a thorough cleaning before you can start printing.

All being ready lay a sheet of paper on the platen, run the rollers over the ink table, forward and back, and take an impression. This first impression should be taken very slowly and carefully, as in case the impression screws, upon which the platen rests and by which the impression is adjusted, are set too far forward, the type in the form would be mashed by a full and heavy impression. The best way is to push the lever down slowly until you can feel a moderate pressure upon the form, then raise sion pushing the lever down a little If one side or corner shows more

when the lever is completely down. grippers are set too close to the platen Now turn the screws up a little. being careful to keep the impresgripper spring and eventually will sion even, until the form prints clear and even. If you can push the lever clear down at the first trial with little or no impression showing, you have simply to turn up the screws until the impression is clear and even. When the impres-

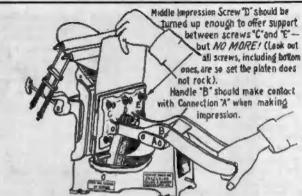

TURNING UP IMPRESSION SCREWS WITH SCREW DRIVER ..

Set nuts must first be loosened. De sure to tighten them after using Impression Screws. If form is weak on one side you may need to tighten Impression Screws, but before doing this see article on makeready.

sion is correctly adjusted the platen should rest firmly on all impression screws, without any rocking,

Getting an Impression

Here is an easy way to start getting the right impression. Turn the impression acres back so there is no impression at all. With the lever and examine the sheet, if the form in the chase, and a sheet only a faint impression shows, you of paper or card on the platen. may take another heavier impres- push down the handle of the press. which will put the rollers on the farther, noting the results, but not ink table, and the platen back and so hard as to punch into the paper. platen will be up against the form m that you can easily get at the impression than the others, loosen impression screws. Now, turn each the impression screws on that side one up with your fingers, making and proceed until the impression is sure that the lock nuts are back light and even all over the sheet far enough so that they do not in-

terfere. Keep turning until you feel each of the screws in contact with the form. From that point you can turn them either by hand or with a screw driver, taking frequent trial impressions on the sheet or card to check on how you are coming. When you have the impression satisfactory (the same the lock nuts to hold the screws where they are, and can apply makeready (patches described elsewhere) on any remaining spots which need bringing up.

Sometimes, through uneven turning up of the impression screws one end so that it does not set parallel to the platen back. The top sure for good results. two impression screws fit into depressed spots un the platen back. as you will see. If the platen has been wrenched around, you can get it back in its proper setting if you set those top screws back in the dents or depressions all, whereas a big form will need made for the purpose.

Be Sure to Get the Handle Down

In order to obtain an even clear print the press handle must be pushed down, not only to make contact with the type, but to bring the impression through the toggle action. The handle of the press, we you will see, is connected to the body or frame by two oval shaped on all corners), you can turn up metal pieces, connections which have on them projections or flanges on the inside, nearest the body. When you bring down your handle, it should make contact, that is, actually touch the flanges on these connections. You will not only feel this contact but you will or for some other reason, the hear a slight click when the metals platen may move up or down on touch. This will give the toggle action a chance to exert its pres-

The amount of pressure you will need to apply to the handle will depend on the amount of type or size of the job you are printing. Thus, a single line card will require practically no pressure at a lot of squeeze. The important thing is not to turn up the im- sizes of some type and o are very pression screws so far you cannot similar and should be noticed carebring the handle down onto the fully; be sure s or S is not upside connections.

turning up the impression screws "wrong font" letters, that is, letters too far and making impression of the same size but different style difficult by using thin paper un- from the rest of the line. Be sure der the low snots to get clear to check all numbers and figures printing. See "Makeready" (un-with the copy, derlay and overlay) in the index. Remove the i patches (as described under the press. "Makeready") do the trick. You'll get better results, easier.

form it is usually necessary to set other characters such = u and n. up the upper screws a little more than the lower ones. The impression should be turned back before putting on another small form. Presses are usually sent out from the factory with the screws turned back so that there is little or no impression until they are turned up.

Correcting the Proof

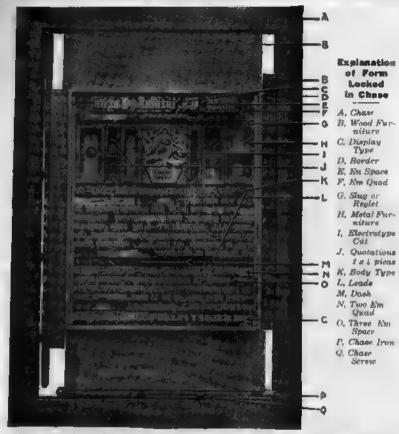

down (8 S). The same applies to On larger forms you can avoid figures 6, 8, 9. Look carefully for

Remove the form from the press, This is important. Go easy on the unlock and correct the errors you impression screws - let paper have marked, lock and replace on

While m a general rule, all corrections should be made in the When you have the impression ad- composing stick to assure good justed, tighten the lock nuts on the justifications, if the change inimpression screws to prevent slip- volves replacing one character ping. When the impression is once with another of equal width, and properly adjusted for the job in you have checked to make sure hand it should not be altered if it that they actually are the same, can be avoided. If some jobs re- the correction can be made in the quire more impression, add a few form. Most figures are of equal sheets more to the platen packing, width (or set, as it is called), and However, to print | full, solid the same will be found of some

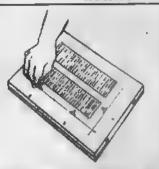

Centering the Work on the Card I Sheet

Take m impression directly m the tympan sheet. This shows exactly where it will were every time and acts a guide in setting gauge pins to feed the sheets against when printing. Mark a line below this print showing where the Having the impression properly edge of card or sheet should adjusted, now take an impression allowing for proper margin, and on a fresh sheet (called a proof) do the at the left side of the and very carefully comparing it sheet. Set gauge pins on these lines. with the copy, examine it for pos- two on the lower (one near each sible errors, marking them on the corner of sheet) and one on the margin. Pay close attention to let- left. Before pressing the little teeth ters of similar appearance such as of the pins into the tympan, feed n and u. I and l. I and l. In small a sheet and make that the po-

Note-The form shown in the picture specially chosen, for illustration, from those used by ourselves, because it shows an unusually large variety of material in use. In ordinary forms many of the items shown are not needed.

sition and margins correct. If set. When everything is O. K., any change is required it be press the teeth firmly into the tymreadily made before the pins are pan sheet. If you have no gauge

pins, three quads or bits of thin wood pasted on the feeding line will answer very well.

To print sheets wider than the platen of your press, use a long cardboard extending to the side, as part of the platen packing. You can then set the side gauge pin on this cardboard.

Getting A Proof Before Putting In The Press

Instead of inking up your press for taking a correction proof you may prefer to follow the way shown in the picture entitled "How to Make # Proof" (page 5). If you expect to do the actual print ing later in the day or at another time you can inking up the press twice - once for proofs and once for printing. Make the necessary corrections from the first proof you pull, then take another proof to make sure there is nothing else to change.

You don't necessarily have to own a galley (which by the way, to do the damage. is a flat metal pan with side open.) The type form can be in the chase, or even standing by itself (securely wrapped around in an hour or less but it is better,

with a number of turns of string). Proceed just as shown in Figures 2 and 3 of the proof-making pictures. Slightly dampening the paper will make taking the proof easier, and News White is ideal for the job. A damp rag run over the paper will give it all the moisture necessary-just enough to make it slightly limp, without signs of water standing on the surface. (That's the way all paper was treated in the days of the Washington hand press the early 19th Century). For an ink table (to get it well spread out on the roller) you can your press ink table, s glazed tile, or a slab of plate glass.

Side gauge pin on projecting card, for printing wide sheets

A Good Way to Prevent Type

Damage

As soon as you have finished a job, and unless you are going to immediately start on another identical one (such as stationery, with only change of name and address) loosen up the grippers and push them out to opposite ends of the platen, then tighten them there. Lots of good type is squashed because the printer forgets to move over his grippers before taking an impression of another form either bigger or in another part of the chase. It only takes one squeeze

Drying the Printed Sheet

Some jobs soft paper will dry

if possible, to let them lie until the next day. Work will dry better if spread out loosely than if it is piled up solid. To prevent smearing on the back of freshly printed sheets (called offset) lay sheets down carefully without slipping or sliding. On fine work it is best to "slipsheet" or lay sheets of paper between the printed sheets until they dry.

A long board on which you lay the sheets in a row as they printed will often give the ink time enough to "set" in the air before it is covered up by another sheet. squeeze and inking capacity, the

Adjusting the Pressure of the Rollers

Rollers may be adjusted to give more less pressure on the type and ink table through the roller hook springs. If more tension desired on the 3 x 5 model, the cotter pin and washer can be taken off the end of the roller hook and the spring stretched out, then replaced. If yours # a 5 x 8 or larger press, pressure can be obtained by turning down the nuts on the ends of the roller hooks (on saddle style presses, tighten the saddle spring nuts).

The ideal pressure is one which makes the press as easy as possible to work, keeps the rollers in place over the type form, yet allows them to turn freely. Important: Before changing any adjustment on the rollers, be that the rolgo through the sockets. The tension on the springs.

Printing Halftone Cuts

Halftones (cuts from photographs or other shaded pictures) have a surface made up of tiny dots (as you will see if you look closely or through a magnifying glass at one). Such cuts take lot more impression and ink than the same amount of type or line cuts. Practically all the illustrations in the Guide and the Printer's Helper are line cuts.

Because of this need for extra printing of halftones larger than one third the size of the chase had best not be attempted.

Makeready (underlay and overlay) is particularly important on halftone printing if good results are to be obtained. You need everything clean and dustless, because any specks on the ink table. rollers or in the ink will transfer themselves to the face of the cut. usually making spots with small white areas around them, which will require cleaning rollers, table and form, and re-inking with uncontaminated ink.

Halftones are best printed on a coated or enameled stock. If they are to be used on rougher surface papers, or on book grades without coating, they should be purchased with a coarser (larger dots) such those used in newspapers.

A soft ink like halftone black is best for cut work. If ink is stiff. it may cause the cut to pick specks of paper from the sheet being ler hooks are oiled where they printed, which will transfer themselves to the rollers and ink table. is more likely to work hard because and then back to the cut. Such of this than because of too much specks act just m dust or pieces of ink skin - they make spots on the cut, often surrounded with halos of white.

The higher the number, the finer the screen (the more dots to to clean your rollers, ink table the square inch). Thus, 133 screen has smaller dots or screen than 120. For work on enameled. coated or glossy stock (including Porcelain Finish Card) we recommend and furnish 100 screen unless otherwise specified, and 85 screen for other grades of book or news paper.

If you are going to run a halftone, be very careful that the ink you put on the press does not the face with a rag. Wipe furnihave any particles of skin in it; ture, chase and all parts of the that your press, rollers and form form with cleaning solution until are entirely free from dust, and everything is perfectly clean. that your ink does not start to "pick" the surface of the paper. Use makeready as described in the Guide and the Course rather than print or other paper on the table a lot of heavy impression, although and running the rollers back and you will need somewhat more forth. The rest may be taken off squeeze than for the same amount by wiping with cleaning solution of type. If you follow through on these details with patience, you ought to get good results.

One other thing - add ink frequently and in small quantities, rather than larger amounts less often. The face of a halftone plate If your press is not used every day, is easily filled up, and if too much it is a good idea to put a thin coating is put on, the results will be poor of oil - the rollers, and, also on the and the cut will have to be given ink table to prevent rusting, but it a good cleaning. On some jobs it must be thoroly cleaned off before may be necessary to clean the putting ink. face occasionally anyway, but that will happen less frequently with the sparing use of ink.

Cleaning Up

gestions for getting good work on time, drop it into its own place in

the pages following, but assuming your work is satisfactorily completed for the time, you will want and type form.

Remove the chase from the press, and before loosening or unlocking. take a rag wet with cleaning solution (or gasoline or benzine) and carefully wipe the face of the form until no ink remains. recommend Printoclene for this purpose. Use a small stiff brush to get the ink out of the crevices, but not until you have first wiped

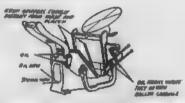

The ink table and rollers may be relieved of a large part of their ink by placing sheet of newsand rags. The general care of rollers will be found elsewhere in this Guide. Proper roller treatment is very important if you want to continue to have good results.

Distributing Type

After cleaning, unlock form, and taking a line at a time, by the aid of a lead or rule, hold it in left There are plenty of other sug- hand, and taking off a letter at a the case, continuing until all is distributed. Use your composing stick for this, if you have one. All rules, leads, reglet, furniture, etc. should also be distributed to their places.

How to Oil Your Press

Oil sparingly but frequently, with machine, motor or sewing machine oil-preferably motor or a fairly heavy oil:

IMPORTANT-For best results in printing, and a long life for your study this diagram.

Gripper Spring, where it goes thru hole in body, underneath handle. Roller Hooks, where they slide thru holes in roller carriage or on presses with saddles, the moving parts.

Roller Ends, oil slightly where they fit in hooks or saddles. All Other Bearings and Joints, that are subject to wear.

Underlays and How They are Used

Underlays used largely for raising cuts high enough so that they will print with type, and also to raise lines words which do not print when press proof is taken. Cuts. wood type, electrotypes, etc. often lower in height than type and must be brought up be leveled by underlaying, as the

UNDERLAYING

FORM TURNED OVER cuts are sometimes lower than type. In this case a piece of thin poper on back of cut will "bring it up." This can also bedone

with a weak section of type.

method of making underlays. Fig- However, when some small porare one is typical form contain- tion of form is low, the impresing a cut, which, while blocked sion screws should not be usedtype high, may need a paper thickness to make it print properly. The back of the form in the chase is shown, with a press proof of the practicable to change them. Under job to be printed.

Figure two shows type needing the same treatment. To make it easy to see, only one word is shown, but the form might contain leaving sheet in the correct spot any amount of type, cuts, or both. with certain parts needing underlay.

Figure three shows the application of an underlay to only small portion of the cut. As in overlay, you can put one, two or more patches of various size on the same general location. Note that usually a smaller patch is needed than the size of the low spot, because the patch has a tendency to raise a larger spot top sheet of the tympan paper. than it covers.

Underlays and overlays are companion helps for you in getting good presswork. Don't rely entirely on impression screws. Part of your form will have too much impression if you do, and it will be harder work to operate the machine.

The Way to Make W Overlay

While the impression screws on your press are there to enable you to increase the impression on any part of the work which does not show up properly, they should not be used indiscriminately. In some printing shops the instructions

If one whole side is low, the im-Our illustrations show the pression screws will correct that. in fact, many times they would affect so much space than necessary that it would not be such circumstances an overlay is best.

Print on a sheet of paper with the register as you want it. Gauge pin at the correct setting. Then, on the gauge pins, make three deep cuts at each of two upper corners | illustrated.

Take the sheet of printed paper from the press and paste it over or under spots where the impression is too light.

Lift bails, and the top sheet of the tympan paper (do not disturb gauge pins). and put the paper with makeready on it under the aligning cuts at corners with cuts in the second sheet of tympan paper. Cover with the top sheet of tympan paper, replacing bails.

The illustrations shown cover the method of procedure very thoroly. For ease of demonstration. one large word is shown, but the system applies equally to m form of small type, cuts, or both-in fact any kind of printing. For convenience's sake the platen is shown as if it were not a part of the press, but it should be understood that no removal of the platen is implied.

As will be seen from the diagrams, several overlays of different sizes may be applied, one over to leave the impression acrews the other, when necessary to bring

un the impression properly. It is also important to ___ that the sheet with the overlays on is in the exact spot to produce the proper results, because if it is little too much to one side or the other, the result will be overimpression in one place, and under-impression in another.

Very thin paper should be used for overlays. Tissue may be used. manifold, or what is known - French folio. The quality of your printing will be determined quite | little by the appearance of the impression. and if you use care with your overlays, you will be very much satisfied with the results.

■ the Printed Impression is Muddy, It May

A (1) Too much ink. A surprisingly small quantity is all that is necessary.

(2) Type form needs cleaning. Be that form dried thoroughly before again running rollers over it, so that cleaning liquid will not dilute the ink and cause more trouble.

(3) Temperature of room is too low. Best results are obtained at 70 degrees or more, at which temperature ink flows freely and rollers at their best.

(4) Rollers are sliding instead of rolling over form. A roller supporter or bearer of wood furniture, locked in the chase at the far side, or one on both sides at THE HEIGHT OF

THE TYPE will often provide a surface which will prevent rollers from sliding. See elsewhere for other causes of sliding.

(5) luk too thick. A very small drop of ink reducer, reducing compound or even kerosene will help. Be to use only a drop.

(6) Ink has too much skin in it. Ink when left in the container with top or cover off will "skin over," and if this skin is put on the ink table, it often causes trouble. Use only clear ink, free from skin.

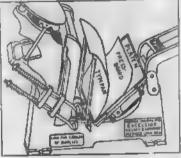

(7) Ink put immediately after cleaning and is diluted by cleaner. Even a drop or so picked up from the crevices in the type form or cracks or cuts in the rollers will affect ink. Clean rollers and ink table bone-dry, then re-ink.

Printed Impression Is Not

Clear

B (1) Not enough impression platen. Put a sheet of waste paper in press (to prevent type from marking tympan or padding) bring handle down so platen is against type and tighten up on perience you will able to quickly

screws on back of platen-juri a little, tightening more on the side which gives the poorest or lightest printed impression. Take another proof, and if this improves but does not entirely remedy the appearance, tighten a little more, gradually bringing up to the proper impression. Large forms will require a stiffer adjustment than small ones. Do not put much pressure on the screws that it shows on the other side of the paper.

(2) The wrong kind of tympan. For small forms, cards, etc., the tympan and packing should be thin and hard, two or three sheets of thin, hard, smooth paper over a thin cardboard. For forms a few sheets may be added. For solid forms of small type a somewhat softer tympan, such as four or five sheets of soft, cheap white paper, may give the best results. Remember that the harder the tympan and the lighter the impression, the sharper and clearer the printing, and the less the wear the type. After a little exchoose the right tympan for any

(3) Needs underlaying. When type or cuts do not print when those surrounding them do, they are probably low. First make sure that the form is planed down level. If this does not overcome it, see article on underlays, pages 19-20.

overlay. See pages 20-21.

(5) Rollers sliding on form. This is fully treated elsewhere.

(6) Not enough ink. This is the least likely of all causes with the beginner, the tendency being to put too much on. You can test this by putting a little more on, and if this does not seem to improve the work, wiping the off again.

(7) Temperature too low. See

"Muddy Impression."

(8) Form not perfectly smooth and flat. This is absolutely essential. If you have not an imposing surface, take chase bed and chase out of the press together, loosen times two or three lines have been chase screws, and tap the form down lightly with the planer and tighten against these long lines, mallet. In the absence of planer, use an absolutely smooth and flat side to side, making sure to cover the whole form in this way. Tightlock up straight, and that unequal pressure will not crack the chase. After tightening them a little, screws.

(9) Type | "off its feet"—that is, does not set squarely on its base. pose ink will handle most work, Planing and relocking the form as but if you printing shaded cuts described above will often remedy or halftones we recommend Halfthis. Sometimes it is caused by not tone ink. Sometimes on very hard spacing out the lines fully, so that surfaced paper of high rag con-

while the chase screws on one side will take hold, those on the other side do not get a chance to squeeze all the lines. Take out a line which is spaced properly, set your composing stick to exactly fit that line.

and then one by one, take out the short lines and respace them as described in the directions. Someover-spaced, causing the form to and leaving the other lines loose. In that case, take out the long piece of wood. Move planer from lines and space them properly. Occasionally - quite often - if the form has a border around it, a lead en chase screws, each one a little or thin piece of furniture will beat a time, so that the form will come slightly misplaced in the locking up, causing the form to pinch in places, and twist out of shape. This will often cause type to plane the form down again, and appear off its feet. The use of finish tightening of the chase corner quads will overcome this trouble. Sm "crooked type forms."

(10) Wrong kind of ink. Many Pur-

tent. stiffer ink is needed. Bond is very easy for a single two point Black ink will be most satisfactory for such work.

- worn. See "How To Take Care of shape. Check wour form and Rollers", page 29.
- (12) Rollers crusted with old ink. See "Care of Rollers." tioned above.
- (13) Type old and worn, an letters mutilated. If your equipment in new, you will have no trouble about worn type, but if you have purchased old equipment, you may have type whose face so worn and rounded that perfect sults almost impossible. A very soft tympan will sometimes produce better work, although it is advisable to turn in the old type for new soon possible. We make a liberal allowance for old type metal in exchange for brand new faces. Be careful to keep the face of good type free from anything that might injure it. Anything left the face of the type, while an impression is taken, will leave its mark. Be very careful that the grippers are never between the form and the platen, before you take an impression. The grippers must always be in a location which will prevent their marring the surface, as must the gauge pins.

Lines Entire Form Are

Crooked

- C(1) Chase screws not equally tight. Take chase out of press, looschase screws and follow directions under "Impression not clear." item 9.
- (2) Lead or piece of furniture misplaced. In locking up a form, it

lead or thin piece of furniture to be accidentally moved just enough to (11) Rollers too hard, old or wedge the form entirely out of look for something of this sort.

> MUST BALANCE UP TO LOCK OR TIGHTEN PROPERTY

<u></u>	817	12 975	
	8PT

Example of correct makeur

Example of incorrect makeup

(3) Too much furniture = side of form. Remember that single two point or even point lead in column of form, if not balanced by an equal amount in the other column or columns, will make the form crooked. If you have a cut somewhere in the form, be very careful to balance it up with an exactly equal amount of type or furniture. Using border or rule around a form will also require careful use of spacing, leads and furniture to keep everything straight.

Type Loose—Form Will

Lock Up Tightly

- D (1) Chase screws not equally tight. See "Crooked Form," Item 1.
 - (2) Lead m furniture misplaced. See "Crooked Form." Item 2.

(3) Too much furniture or leads on one side. See "Crooked Form," Item 3.

(4) Lines equally spaced. See "Impression not clear." Item 9.

(S) If you are men that your form is made up properly, that is, none of the furniture, leads or type are misplaced so to make proper tightening impossible, locate the part of the form which seems to be loose, cut strips of thin paper, and place them between the lines which loose, taking care not to put enough in any line to make it appear noticeably spaced in the printed page. It is very seldom that this must be resorted to, one of the other suggestions mentioned usually being the cause.

Rollers Slide Over Form or Refuse to Take Ink

E(1) A roller supporter, bearer or track locked in the form on one side or the other. both sides, will often prevent sliding. Bearer must be locked in at EXACTLY TYPE HEIGHT. otherwise the rollers will either fail to touch the type, or they will not ride on the bearer. These bearers must be in place where they will not touch the paper or card when the impression is made must be shielded by m paper pasted to the gripper. See page 22.

(2) Rollers too hard or too worn. See "Care of Rollers"

- (3) Rollers too crusted with ink. See "Care of Rollers."
- giving proper tension. On some you. Everybody you know is a prosmodels adjustable nuts provid- pect for stationery and cards at ed. On others springs may be the very least. People have acquired

stretched out, or newer and stronger springs provided.

- (5) Rollers bind in roller hooks. Use a little oil where rollers fit into hook.
- (6) Rollers won't take ink. This is caused by excess moisture in the rollers, and sometimes occurs during damp, hot summer weather. See "Care of Rollers." Make that, after cleaning rollers with kerosene or any other cleaning substance, they dry well = are dried before again putting ink.

Light Streaks Across Face of Letters

- First line of type has light streaks in ink running horizontally across the face of letters.
- (1) Rollers sliding. See Item E-1 and "Care of Rollers."
- (2) Room too cold to start. See Item A-3.
- (3) lak too thin. This may come from dilution by cleaner. See A-7. If ink is very old, the oil may have separated enough from the pigment to give a thin solution, but not often and never with ink furnished with new equipment.

How to Start a Stationery and Job Printing Business

It might almost be said that business of this kind will start itself, measy is it to obtain orders. Just let it be known among friends, relatives and acquaintances that you have a printing outfit, and you (4) Springs on roller hooks not will have plenty of jobs offered

the habit of using stationery with tickets, programs, notices, due name, monogram or address, and slips, etc. Make the most of all this opens up a tremendous market your opportunities. Dozens of them for you in stationery alone, to say nothing of cards, tickets, programs, advertising matter, billheads, factory and office forms, statements, handbills, menus, church calendars, lodge and club printing, etc. We furnish a complete line of blank stationery of all kinds. both boxed and unboxed, cards, paper, blotters, etc.

If you want to get your husiness started quickly, print up a small card, or better yet a blotter, giving your name and address and announcing that you are prepared to do printing at attractive prices. If you - large enough card, get in a little "selling talk"-that is. state why everyone should have his name and address - every letter he sends out (because of the good appearance, because if undelivered it will be returned, etc.) Offer to call and talk it over with the prospective purchaser. Distribute these cards or blotters from door to door, by mail, or among any gathering you may attend, Returns will not be long in coming. "It Pays to Advertise"-In fact, many lines of business cannot exist without advertisingand in addition to doing advertising yourself, you can print advertising for others-at a profit. Suggest new ways of advertising to your business customers. Small calendars and cards, blotters, puzzles of one kind or another, card game score cards, railroad, plane, and bus schedules, baseball score cards, sports calendars and dozens of others. If you belong to a lodge, club, church or any organization, you already have an inside

will show if you are wide awake.

It is not possible to lay down invariable rules for prices, because competition makes them vary in different localities. Far West or South prices are as a general rule higher, because of being farther from source of supplies. The prices given below should therefore be considered only for the help they give you to establish fair figures. A little quiet investigation in your locality will soon give you a line on quotations prevailing, after which you will be able to do just as well anybody-and better, if

you want to.

Visiting cards, name only, 50 for \$2.70, 60 cents for each additional line (address, etc.) Business Cards, 100 for \$4.95 (one line) 60 cents for each additional line and about \$1.80 to \$2.70 for each of any additional hundred printed. Price should vary on Business Cards according to size of card used. This price for small or medium. Low priced bond stationery, 100 6x7 sheets and 100 envelopes. \$3.15 and higher prices for m better grade, up to \$10.80 for raised printed stationery in the same quantity, with proportionate prices for a larger number of sheets. Statements and Bill Heads, 250 for \$8.70. Low priced bond. 8 %x11 Business Letter Heads 250 for \$8.70, Envelopes \$6.30, 1,000 sheets for \$13.95, Envelopes. \$14.00, 60 cents a line additional for more than three lines. Better grades and raised printtrack to many profitable jobs of ing higher - according pa-

color work, \$6.30 extra. Small handbills and circulars, 3x5, 100 for \$9.00, 1,000 for \$13.50, Add \$6.30 for extra color in all cases more if it is a bigger job or larger edition. Larger circulars-in pronortion to size and number required. Tags same as envelopes.

Keep a record of time and cost on all jobs, for in making future

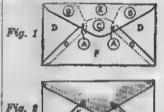

prices.

Envelope Printing

Envelopes, owing to the various thicknesses of paper at different points, often require a little more work in preparation for printing than | iob | single sheet of paper. The overlapping and the gum which holds the flaps cause thick places which must be compensated for if the printing goes over more than ___ different thickness. Sometimes this me be avoided by opening out the flaps, particularly when the corner card you going to print is small, and the envelope is "high cut"-that is. the top of the back side is almost parallel with the top of the front. In this case, you will be printing two thicknesses of paper, but not two different thicknesses. that the type will not be held off one part of the envelope by two more thicknesses in one spot, other, the number of thickand a fewer number in another.

the flap itself, and the corner card 1 of the illustration, there are four will over more than one dif- thicknesses of paper, and all the ferent layer of paper, I is custom- other points must in built up to

How to Take Care of

important parts of your printing grades. The summer rollers press and in order to produce good made much harder than the winter printing, it is very important that rollers to help overcome the differyou take care of your rollers as outlined in these instructions.

Rollers should be much like the human skin in feeling. They extremely susceptible to heat, cold and varying degrees of moisture in the air. On damp, muggy, summer days, rollers will absorb moisture, become water-logged, and will not distribute ink satisfactorily. When a roller is in this condition. it becomes soft and will increase from 1/16 to 1/2 of an inch in diamster. To overcome this condition. wipe off the rollers very carefully - so not to spoil the surface -repeatedly with a soft cloth wet with alcohol, or in really cover the rollers with powdered alum, rubbed with the hand. Let them stand for while and wipe with a DRY cloth. If the rollers only slightly swelled and appear to be tough enough to stand use, you can wind a little bicycle or electric tape around the roller wheels to make them approximately the diameter as the rollers.

In the winter time, conditions just reversed. The atmosphere is cold and dry, your print shop is heated, the moisture dries out of your rollers and they in turn harden up and shrink in size. Oftentimes. - roller in this condition may be brought back by coat- Note-When coating rollers with ing it over with mixture of one oil to keep them from shrinking part alcohol and part glycar- swelling, coat the ends also. (Be ine, letting it stand near | pan of sure to coat over all of the comwater several bours.

To partly compensate for these two extremes. have two kinds Ink rollers are one of the most of rollers, winter and ence in humidity.

In some localities, where the climate is always humid or always dry the year round you may need either summer rollers all year. winter rollers all year, mgardless of the calendar. Printers in San Francisco Bay region say that they get the best results with hard rollers in winter and soft rollers in summer, because of greater humidity in winter than summer. In warm dry climates such - Arizona and New Mexico, a winter roller will work well. If you do not want the rollers normally sent out because of these varying conditions, PLEASE SPECIFY WHEN YOU ORDER. But, matter how make the rollers. you must do your part.

After use, rollers should be carefully cleaned at once while the ink is fresh and easily removed. Use Printoclene, thin machine oil, - kerand cloth to soften and wipe off the ink. After the rollers thoroughly cleaned, give them heavy coating of machine of and stand them up vertically on a bench board or in a box. If you will be to keep them covered with machine oil not in use. they will not only last longer, but will be in the proper condition when you want to use them.

A hacksaw or ____ other kind of metal saw is to be preferred over a carpenter's saw, the ordinary wood saw having a tendency i lose its keen edge on lineleum.

All kinds of decorations may be Make that the sides of the large letters or words when needed in an emergency. Two. by cutting | block for each one. Handsome Christmas and other greeting cards are made from them, and you don't have to be an artist, either. Illustrations for books, pamphlets advertising may be produced not only at cost of block only, but in the manner used in the best work - for linoleum cuts used as much for their good appearance m for their economy.

Plastic blocks, even smoother, also available for cutting in the same

Gold, Silver and Bronze Work

Years ago a great deal of gold and silver printing was done by dusting still damp ink with bronze powder. This has been superseded largely by straight printing from gold and silver inks, due to greatly improved formulas for the inks

Silver ink comes already mixed, but gold, if furnished that way separately, and are mixed on the job. Directions are furnished with the ink, but there is nothing com-

Some very interesting effects may be obtained by using silver or gold in colored inks to make metallic tints, just mare seen in motor car finishes. You arrive at various shades with more or less metallic sheen by experimenting, or the samples III the

Full form

First color

Second color

How to print two colors from one form.

Kelsey color cards to ge by. In fine results; as a letter head of general, a small amount of color blue paper printed with dark blue is used in proportion to the gold or silver. In addition to all this, there is gold and silver raised printing with the inks, compounds and raised printing heating unit shown in the catalog. Very attractive engraved effects are possible, especially for stationery and greeting cards.

If you have not explored the possibilities of gold and silver colored metallic effects, you are overlooking several good bets.

Printing in Color

Many jobs make a better appearance if printed in munn other color than black, or in two colors.

In using color, be careful not to overdo it. You will find on most small work a single line or a few dashes or ornaments in red is all that is needed to make a fine effect. A handsome fob can be done by using two shades of the same color, as light and dark blue or light and dark brown, etc. Similarly, using paper and ink of different shades of the same color produces very the lightest color first.

ink. In setting up a job to be printed in two colors, set the whole job at once, the same as though intended for one color, lock it in the chase and make a press proof as usual. In this way you can see how the complete job will appear, and any changes that may be necessary in arrangement or spacing should be made now. When everything is satisfactory, unlock the form and lift out the lines which are to be printed in the second color, placing them on salley or composing stick, and fill in the spaces in the form with leads or regiet of the same size us the type taken out.

When the first color is printed, replace the type in the form and take out that used for the first color, filling up the empty spaces as before. If you do this correctly the two colors will register exactly. It is a good plan to print several copies of the complete form before breaking up for colors, and lay them aside to use as test sheets. The color forms should print directly over these. Always print

Movie and Photo Printing

Thousands of movie cameras are in use and there is a growing demand for better movie titling. With all due respect to the host of titling schemes, for finished professional appearance there is nothing which quite equals a title made on a printing press. Sharp, clear on the negative, the letters will letters of correct proportions en- show white un the finished card or large on the screen without annoy-ing blemishes. The printer with used. Regular printer's ink will small or medium size equipment is be satisfactory to use on negatives well fitted to go after this busi- and also on prints, although some ness, and should be encouraged by people prefer to use the stiffer the knowledge that thousands of bond ink on post card stock. movie makers have bought present for that purpose alone.

One of the larger manufactures recommends using vellum finish cardboard for titles, which helps to avoid unwanted glare or reflection of light when the card is photographed.

Titles are printed in black on white, in white un black, in silver on black, or (for color movies) in colors. Little decorative cuts may be used. Many movie enthusiasts make up special backgrounds for their titles, and photograph them, perhaps with a still camera, after which they require overprinting with lines of type.

The size of the titles required will depend on the equipment which the camera owner has for reproducing them. Most movie photo-graphers read magazines which give them a wealth of information on the subject, so we will not go into details here, except to remark that it may be well to remind prospects that they can get so-called liquify, which it will do immedpositive film, that is, film which lately. Remove the sheet and the will enable the printer to use black compound will solidify instantly.

same final effect in the title on the serven.

Like movie titles, there is business to be obtained in titling photographs, including photo post cards. Many photographers have presses for this work alone. Titling can be done in black on the finished print, or on the negative. If done

Raised Printing Like Engraving or Embossing

A good portion of the cards, stationery and such work which you see, and which have the raised appearance of engraving, are not engraved at all, but produced with a printing press and type, like yours.

All you need, aside from your regular outfit, is either gloss or dull raised printing compound, and a source of heat. Hurs is

how it goes:

Set up the form, and print in the usual manner. While the ink is still moist, dust each sheet lightly with the compound. (You'll find it in the supply book under "Raised printing compounds.") Shake off the surplus, and put for second near enough a heater (like a toaster, table stove or electric hot plate) for the powder to ink instead of white, yet give the no that you mu lay one on anThe result will be either a glossy can make them yourself an linoraised or a dull slightly raised leum blocks, described elsewhere. effect, depending on which kind of compound you use, the gloss imprinting. You can obtain the or the dull.

For general purposes the gloss compound is usually best, but for wedding announcements and business cards which must look engraved, the dull should be used. The raising is not so pronounced cards begins in the summer months. on the dull, but it is more in Orders can be taken in July. Augkeeping with plate engraving.

For these, print with brown, tan or yellow ink, as the compounds are not transparent, and will not allow the colors of the ink to show
